

Admin Dashboard User Guide

Purpose

This guide explains how we use the Admin Dashboard in the current SentinaAI build. It is written for super admin users who need to manage user accounts, review roles, update user details, and inspect rule-based assistant chat logs across the platform. The Admin Dashboard is built to support secure user administration in one place while also giving administrators visibility into assistant usage across operations, sustainability, SOC, and exhibitor roles.

Who this guide is for

We use this guide when we need to:

- review the current user list
- create a new user account
- edit an existing user account
- check role assignments
- review account status, creation date, and last active date
- search and filter assistant chat logs
- open detailed assistant log payloads
- sign out of the admin area

Before we begin

Before using this area, we should make sure:

- we are logged in with a super admin account
- the backend API is running
- the users service is available
- roles are loading correctly from the backend
- assistant log services are available if we need chat log review
- if services are delayed or unavailable, the page may still open but show empty tables, missing roles, or error banners

Main layout

Top bar

The Admin Dashboard uses a simpler layout than the role-based dashboards. The dark top bar includes the SentinaAI brand, the signed-in user information, avatar, and Logout button.

Main Content Card

The main content area opens inside a large white card titled

Super Admin Dashboard.

This card contains the User Management section first, followed by the Rule-Based Assistant Chat Logs section.

Logout

Logout clears the active session and returns us to the login page

Dashboard home

Main actions

The main button in this section is + Add User. Selecting it opens the Create New User modal.

User table

The user table is where we review existing accounts and start create or edit actions.

- Employee ID
- Name
- Email
- Role
- Status
- Created
- Last Active
- Edit action

Protected rows

The Edit button is shown for normal users. Super admin rows are protected from the standard edit action in the current build.

Create New User modal

Selecting + Add User opens the Create New User modal. This is where we enter the new account details and validate password requirements before creating the user.

- Full Name
- Email
- Password
- Show or Hide password
- Role selector
- password rules panel
- Cancel
- Create User

Password rules

The password rules panel gives live feedback for these requirements:

- Minimum 12 characters
- 1 uppercase letter
- 1 lowercase letter
- 1 number
- 1 special character (., @, \$, etc.)

Role selector

The Select Role field is populated from the backend roles endpoint. If no roles load, the modal shows an error message so the issue can be fixed before account creation.

Edit User modal

Selecting Edit on a supported user row opens the Edit User modal. In the current build, this modal allows us to update the selected user's full name, email, role, and status, then save the changes back to the backend.

Rule-Based Assistant Chat Logs section

This area gives administrators a cross-platform view of assistant usage across operations, sustainability, SOC, and exhibitor users.

- search by user, query, summary, role, or session
- filter by role
- filter by response status
- review the latest returned summary
- open full details for a log row
- inspect structured payload data

Main controls

The current controls are Search, All roles, and All statuses.

Main columns

The logs table is designed around these main columns:

- Time
- User

- Role
- Query
- Status
- Summary
- Session
- View or Hide details

Viewing assistant log details

Each log row includes a View button. Selecting it expands a details row directly below the entry. The expanded details area can include Intent, Response type, Scope, Latency, and Payload JSON.

This is useful when we need to understand not only what the assistant returned, but how the request was categorized and what structured entities were captured in the workflow.

How to create a new user

1 Open the Admin Dashboard. 2 Select + Add User. 3 Enter full name and email. 4 Enter a password. 5 Check the password rules panel until all requirements are satisfied. 6 Choose the correct role. 7 Select Create User.

How to edit a user

1 Find the user in the User Management table. 2 Select Edit. 3 Update the allowed fields such as name, email, role, or status. 4 Save the changes.

How to review assistant logs

1 Open the Rule-Based Assistant Chat Logs section. 2 Use the search box if we know the user, session, or query. 3 Apply role or status filters if needed. 4 Review the summary in the main row. 5 Select View to inspect the detailed payload.

Good working practice

- verify the correct role before creating a user
- check password requirements before submitting the form
- review Last Active when checking whether an account is still in use
- use chat log filters before reading long result sets
- open the details row when a summary is too short to understand the workflow
- log out after finishing administrative work

Common issues

No roles loaded in the Create New User modal

This usually means the roles endpoint did not return valid role data. The modal shows a backend warning so the issue can be checked before trying again.

Create User stays blocked

Check whether required fields are missing or the password rules are not all satisfied yet.

Assistant logs do not load

Check whether the authentication token is still valid and whether the assistant logs endpoint is available. The page shows an error banner when log loading fails.

No assistant logs found for the selected filters

This usually means the current search, role, or status filter is too narrow for the available data.

Current build note

This guide reflects the Admin Dashboard page currently wired into the build:

- User Management table
- Create New User modal
- Edit User modal
- Rule-Based Assistant Chat Logs section
